## Announcement.....Google Search

We now have a new transmitter search available using the Deeper Image Television web site home page. Choose either digital or analogue and plug in your post code. A google map will come up showing the locations of the transmitters. There is some refinement to do around the descriptions but all the information is there. Reading across the page:

**Call sign and a set of numbers.** This is the

nominated channel number given to the transmitted channel.

**V or H** for vertical or horizontal polarisation.

**OD or DA** for omni directional transmission from the transmitter meaning a full 360 degrees or DA for directional transmission to a limited area only.

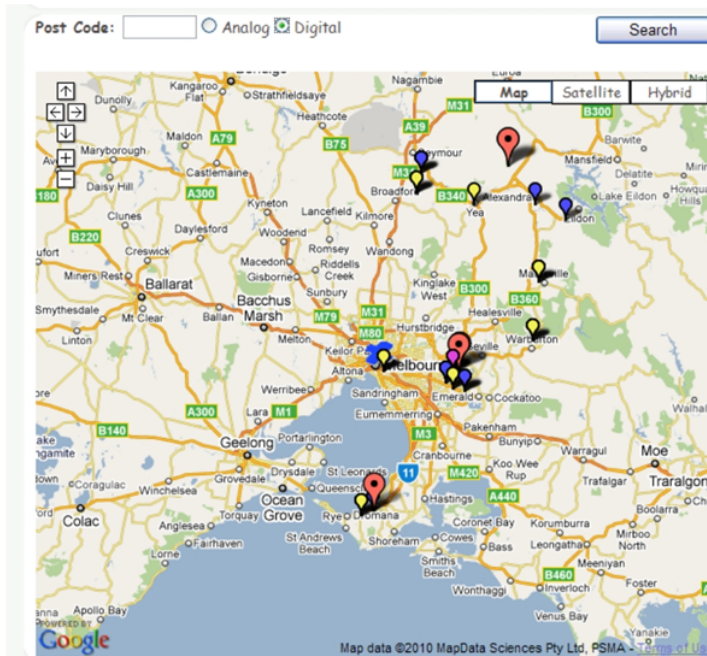

**ERP** Effective Radiated Power. This will tell caravanners the size of the transmitter. Anything under

5000 is a baby one. This number more than anything else dictates how far away you can be and still receive the signal. A couple of examples: 100 ERP No more than a 10 kilometers provided the signal path is reasonable. Flat, nothing in the way maybe a bit further.

1,000,000 ERP like Bendigo in Victoria you could be 140 kilometers away and still receive it.

This measurement is very important in estimating what transmitter to go for.

Transmitting site is next. Where the actual transmitter is located.
